

I've been talking about $\psi(x)$.

~~I~~ I could also talk about $\psi(p)$ instead.

e.g. What is the probability that a particle has a momentum between -1 & 1 .

e.g. What is probability that a particle has a position between -1 & 1 .

$$P = \int_{-1}^1 |\psi(x)|^2 dx$$

$$P = \int_{-1}^1 |\psi(p)|^2 dp$$

$$\psi(x) = \langle x | \psi \rangle$$

$$\psi(p) = \langle p | \psi \rangle = \int_{-\infty}^{\infty} \overset{\psi_p}{\psi_p^*(x)} \psi(x) dx$$

I need ψ_p in terms of x .

$$\psi_p(x) = \frac{1}{\sqrt{2\pi\hbar}} e^{ipx/\hbar}$$

$$\hat{p} \psi_p(x) = p \psi_p(x)$$

$$\int_{-\infty}^{\infty} |\psi_p|^2 dx = 1$$

$$\psi(p) = \frac{1}{\sqrt{2\pi\hbar}} \int_{-\infty}^{\infty} e^{-ipx/\hbar} \psi(x) dx$$

Chapter 4: QM in three dimensions (spherical coordinates)

$$i\hbar \frac{d\Psi}{dt} = H\Psi$$

$$\text{in 1D: } H = -\frac{\hbar^2}{2m} \frac{d^2}{dx^2} + V$$

$$\text{3D, } H = -\frac{\hbar^2}{2m} \nabla^2 + V$$

$$\nabla^2 = \frac{d^2}{dx^2} + \frac{d^2}{dy^2} + \frac{d^2}{dz^2}$$

$$\int |\Psi|^2 d\vec{r} = 1 \quad \text{normalization}$$

If $\Psi_n(\vec{r})$ are energy eigenstates,

$$\text{i.e. } H\Psi_n(\vec{r}) = E_n\Psi_n(\vec{r})$$

$$\text{then any } \Psi(\vec{r}, t) = \sum_n c_n \Psi_n(\vec{r}) e^{-iE_n t/\hbar}$$

wavefunction

assuming H is time-independent

$$\begin{aligned}x &= r \cos \phi \sin \theta \\y &= r \sin \phi \sin \theta \\z &= r \cos \theta\end{aligned}$$

$$\nabla^2 = \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \frac{\partial}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial}{\partial \theta} \right) + \frac{1}{r^2 \sin^2 \theta} \left(\frac{\partial^2}{\partial \phi^2} \right)$$

Laplacian in spherical coordinates

Energy eigenstates satisfy $H\psi = E\psi$

$$-\frac{\hbar^2}{2m} \nabla^2 \psi + V\psi = E\psi$$

To solve, use separation of variables

$$\psi(r, \theta, \phi) = R(r) \Theta(\theta) \Phi(\phi)$$

$$\Phi'' = -m^2 \Phi \quad \phi \neq 0$$

$$\rightarrow \Phi = A e^{im\phi} + B e^{-im\phi}$$

Let m be $+$ or $-$

Because $\phi + 2\pi \Leftrightarrow \phi$

$$\Phi(\phi + 2\pi) = \Phi(\phi)$$

$$\Phi(\phi + 2\pi) = e^{im\phi} e^{im2\pi} = e^{im\phi}$$

m must be an integer

$$\frac{1}{\Theta} \left[\sin \theta \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial \Theta}{\partial \theta} \right) + l(l+1) \sin^2 \theta \right] = m^2$$

$$\Theta(\theta) = A P_l^m(\cos \theta)$$

Associated Legendre function

$$P_l^m(x) = (1-x^2)^{|m|/2} \left(\frac{d}{dx} \right)^{|m|} P_l(x)$$

Legendre polynomial

$$P_l(x) = \frac{1}{2^l l!} \left(\frac{d}{dx} \right)^l (x^2-1)^l$$

$P_l^m(x)$ blows up in the $-1 \leq x \leq 1$ range unless l is an integer, $l \geq 0$.

$$P_l^m(x) = \frac{1}{2^l l!} (1-x^2)^{|m|/2} \left(\frac{d}{dx} \right)^{l+|m|} (x^2-1)^l$$

I can only take $2l$ derivatives of $(x^2-1)^l$ before I get zero, and so

$$\begin{aligned}l + |m| &\leq 2l \\ |m| &\leq l\end{aligned}$$

$$m = \underbrace{-l, -l+1, \dots, l-1, l}$$

$$Y_l^m(\theta, \phi) = A e^{im\phi} P_l^m(\cos \theta) = \Theta(\theta) \Phi(\phi)$$

$$A = \sqrt{\frac{2l+1}{4\pi} \frac{(l-|m|)!}{(l+|m|)!}} \times \begin{cases} (-1)^m & m \geq 0 \\ 1 & m \leq 0 \end{cases}$$

Spherical harmonic functions

$$\int_0^{2\pi} \int_0^\pi Y_l^m Y_{l'}^{m'} \sin \theta \, d\theta \, d\phi = \delta_{ll'} \delta_{mm'}$$

they are orthogonal.
